EDUCATION

Tecnológico de Monterrey (ITESM) | 2024 – Present | Graduation June 2028

Bachelor Computer Technologies Engineering: GPA 93/100

Relevant coursework: Data Structures & Algorithms, OOP (C++ / Python), Software Engineering, Formal Languages & Computational Theory, Database Systems, Networking & Device Interconnection.

WORK EXPERIENCE

Intern — Frontend Developer — Jun/ Aug 2025
Bono, Mexico City

- Developed and iterated on React components within a production codebase, incorporating code review feedback to meet quality standards in a real engineering team.
- Participated in client calls, capturing requirements and translating non-technical feedback into concrete development tasks delivered within sprint deadlines.
- Acted as a bridge between the business and technical sides — ensuring client expectations were accurately reflected in the product without losing technical feasibility.

Administrative Team Member — Jun 2025/ 2026
COPARMEX University Chapter, Tecnológico de Monterrey

- Led end-to-end execution of 3+ business networking events, directly managing speaker outreach, agenda coordination, and cross-team logistics across dedicated planning and operations teams.
- Served as the primary point of contact between speakers, university stakeholders, and internal coordination teams, ensuring alignment across all moving parts from planning to day-of execution.
- Drove cross-functional collaboration between academic and professional stakeholders, strengthening the chapter's network and operational capacity.

PROJECTS

Radyex — Full-Stack Clinical Platform for a Dental Radiology Clinic, 2026

Next.js, TypeScript, PostgreSQL, Role-Based Access Control

• Digitized the referral workflow for doctors: 10-minute paper orders filled out on-site, plus an in-person pickup about a week later, became 5-minute online orders with results delivered straight to the doctor's profile.

• Replaced physical patient archives with searchable digital records, cutting file retrieval from up to 5 hours to minutes and reducing the clinic's storage space and costs.

• Built the platform end to end: patient records, radiograph upload and download, scheduling, role-based access for admins, staff and referring doctors, and an admin reporting panel.

Downhill México — Full Stack Web Platform — Mexico City 2025
JavaScript, HTML/CSS, PostgreSQL, REST APIs

• Designed and developed an end-to-end full stack platform for a mountain bike competition organization, contributing to a 30% increase in registered competitors within the first season of platform deployment.

• Engineered frontend features including event calendar, athlete profile management, real-time standings table, photo gallery, and news section.

• Implemented backend architecture including session-based authentication, SQL database management, REST API integration, data persistence, and server-side push notifications.

Bono — Carbon Footprint SaaS Platform — Mexico City, 2025
React, JavaScript, HTML/CSS, Frontend Development

• Identified a gap in corporate carbon accounting and independently architected a SaaS platform end-to-end, winning the company hackathon and converting the prototype into a direct internship offer.

• Designed and developed 10+ production React components with real business logic, collaborating with the technical team on user-facing features from requirement definition to deployment.

Authentication Log Search System — Mexico City 2025

C++, Merge Sort, Binary Search, Big O Analysis

• Conducted a comparative performance study on sorting and search strategies by engineering a C++ system that processed ~20,000 security log entries with timestamp-based interval and count retrieval.

• Evaluated two approaches via a polymorphic interface: binary insertion sort (O(n) per insert, continuously sorted) vs. Merge Sort on full dataset load (O(n log n)), both leveraging binary search for O(log n) retrieval, empirical benchmarks compared single-insert and batch-insert scenarios to validate theoretical complexity predictions.

The Coward King — Full-Stack Game with Relational Database, 2025

MySQL, REST APIs, Node.js/Express, JavaScript, HTML, CSS

• Delivered a fully playable roguelite game, with original characters, lore and mechanics, in a team of 3, covering the full development cycle: functional and non-functional requirements, sprint planning and Scrum-based task assignment.

• Designed the MySQL database with stored procedures and triggers, connected to the game through a Node.js/Express REST API.

• Built player and community statistics using SQL joins and aggregations, so players could track their progress and the team could analyze how the community played.

SKILLS

- **Data**:SQL (joins, aggregations, stored procedures, triggers), relational data modeling, MySQL, PostgreSQL, Python (Pandas) for data cleaning and analysis
- **Languages**: C++, Python, JavaScript, HTML, CSS, SQL, Matlab
- **Frameworks & Tools:** React, Node.js, Git, VS Code, Next.js , Typescript, Express
- **Concepts:** OOP, Data Structures & Algorithms, Big O Analysis, REST APIs, Client Requirements Analysis, Software Documentation
- **Soft Skills:** Stakeholder management, Technical communication, Cross-functional leadership, Delivery under pressure, Autonomous execution, Collaboration
- **Languages (spoken):** Spanish (native), English (advanced — technical & professional)
